

Put the DTA Sales backend on dtaonline.in

Step-by-step guide · about 15–20 minutes · no coding needed

Important: use a **NEW, separate database** for DTA Sales. Do **not** reuse the database of the other DTA app (the one at `/DTA_Internal`) — both apps use tables with the same names and would break each other. The setup page checks this and stops safely if it finds the old app's tables.

What you need

- Your Hostinger login (hPanel) for **dtaonline.in**
- The file **DTA_Sales_backend_upload.zip** (sent with this guide)
- A notepad to write down 3 database details and your admin key

Part 1 — On Hostinger

1 Create a new database

hPanel → your website **dtaonline.in** → **Databases** → **Management** (MySQL Databases). Create a **new database + user**: name it `dtasales` (Hostinger adds its own prefix), choose a user name and a **strong password**, then click **Create**.

Write down exactly as shown (with the prefix): database name · user name · password.

Example: `u123456789_dtasales` .

2 Make the folder

hPanel → **File Manager** → open `public_html` → **New Folder** → name it exactly `DTA_Sales` (capital D-T-A, underscore, capital S). It sits next to your existing `DTA_Internal` folder. Open the new folder.

3 Upload and unzip

Click **Upload** → choose **DTA_Sales_backend_upload.zip**. When it appears, right-click it → **Extract** → extract into the **current folder** (not a new sub-folder).

You should now see `api.php` · `db.php` · `setup.php` · `config.php` · `.htaccess` directly inside `DTA_Sales` . (If `.htaccess` is not shown, turn on "Show hidden files" in File Manager settings.)

Then **delete the ZIP file** from the server — it contains your private admin key.

4

Fill in your database details

Right-click `config.php` → **Edit**. Replace the three `PUT_..._HERE` values with the database name, user name and password from step 1. Keep the quote marks. Click **Save**.

Do not change the `admin_key` line. It is your **main portal key** — copy it now into a safe place (a password manager). You need it once, to create your admin account. **Never share it with employees.**

Optional: put your email in `notify_email` to get an email for every new demo request.

5

Run the setup check

In your browser open: `https://dtaonline.in/DTA_Sales/setup.php`

Every line should show **[OK]**, ending with "Everything is ready" — the page then deletes itself. If any line shows **[FAIL]**, see the help table below, fix it, and reload.

6

Check the connection

Open `https://dtaonline.in/DTA_Sales/api.php` — you should see:

```
{"ok":true,"service":"dta-sales-api"}
```

Part 2 — In the DTA Sales app

7

Create your admin account (once)

Install and open the DTA Sales app (Windows installer) → on the login screen click **"First-time setup: create admin account"**. Enter your **admin key** (from `config.php`), your name, a login ID, and a password of at least 8 characters. This only works once — after it, nobody can create another admin.

8

Create the employees' logins

Sales team → + **Create employee login**: name, login ID, state, and a password (press **Generate** for a strong one). Copy the login ID and password from the box that appears and send them to the employee. Only you can create logins; use **Lock / Unlock** any time.

9

Test before you roll out

Create one test employee, log in as them (log out first), add a lead, and confirm you can see it as admin. Then give the installer and logins to the team.

If something goes wrong

What you see	What to do
[FAIL] this is a NEW, separate database	You used the old app's database. Create a brand-new database (step 1) and put its details in <code>config.php</code> . Nothing was changed.
[FAIL] database connection failed	The name, user or password in <code>config.php</code> is wrong. Copy them exactly, including the Hostinger prefix. Keep <code>'localhost'</code> as the host.
[FAIL] config.php exists	The file is missing or named wrongly (e.g. <code>config.php.txt</code>) or is in the wrong folder.

[FAIL] admin_key is set...	The admin_key line was changed or shortened. Re-upload the ZIP's original config.php.
[FAIL] opened over HTTPS	Type https:// in the address. If the site has no SSL, enable the free SSL for dtaonline.in in hPanel.
[FAIL] PHP 8.0 or newer	hPanel → Advanced → PHP Configuration → choose PHP 8.1 or newer.
404 Not Found on setup.php	The files are in the wrong place (for example DTA_Sales/DTA_Sales/). Move them directly into public_html/DTA_Sales .
"Could not reach the server" in the app	Open the api.php address (step 6) in a browser. If it does not show the ok message, recheck steps 2–5.
Blank page / error 500	Check config.php for a missing quote or comma; see the error log in hPanel.
I forgot my admin password	Upload <code>reset-admin-password.php</code> (from <code>sales-app/backend</code> in the project), open it in the browser, enter the admin key and a new password, then delete that file .

Keep it safe: keep your admin key private; use **Sales team → Backup to this computer** regularly; turn on Hostinger's automatic backups if your plan has them. Menu names in hPanel can look slightly different — the idea is the same.
